11. Common Roots:

Consider two quadratic equations, $a_1x^2 + b_1x + c_1 = 0$ & $a_2x^2 + b_2x + c_2 = 0$.

(i) If two quadratic equations have both roots common, then the equations are identical and their co-efficient are in proportion.

i.e. $\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$.

(ii) If only one root is common, then the common root 'α' will be :

$$\alpha = \frac{c_1a_2 - c_2a_1}{a_1b_2 - a_2b_1} = \frac{b_1c_2 - b_2c_1}{c_1a_2 - c_2a_1}$$

Hence the condition for one common root is :

$$\Rightarrow \quad (c_1a_2 - c_2a_1)^2 = (a_1b_2 - a_2b_1)(b_1c_2 - b_2c_1)$$

Note : If $f(x) = 0$ & $g(x) = 0$ are two polynomial equation having some common root(s) then those common root(s) is/are also the root(s) of $h(x) \equiv a f(x) + bg(x) = 0$.

Example # 16 : If $x^2 - ax + b = 0$ and $x^2 - px + q = 0$ have a root in common and the second equation has equal roots, show that $b + q = \frac{ap}{2}$.

Solution : Given equations are : $x^2 - ax + b = 0$ .... (i)

and $x^2 - px + q = 0$. .... (ii)

Let α be the common root. Then roots of equation (ii) will be α and α. Let β be the other root of equation (i). Thus roots of equation (i) are α, β and those of equation (ii) are α, α.

Now $\alpha + \beta = a$

$\alpha\beta = b$ .... (iii)

$2\alpha = p$ .... (iv)

$\alpha^2 = q$ .... (v)

L.H.S. $= b + q = \alpha\beta + \alpha^2 = \alpha(\alpha + \beta)$ .... (vi)

.... (vii)

and R.H.S. $= \frac{ap}{2} = \frac{(\alpha + \beta)2\alpha}{2} = \alpha(\alpha + \beta)$ .... (viii)

from (vii) and (viii), L.H.S. = R.H.S.

Example # 17 : If a, b, c $\in$ R and equations $ax^2 + bx + c = 0$ and $x^2 + 2x + 9 = 0$ have a common root, show that a : b : c = 1 : 2 : 9.

Solution : Given equations are $x^2 + 2x + 9 = 0$ .... (i)

and $ax^2 + bx + c = 0$ .... (ii)

Clearly roots of equation (i) are imaginary since equation (i) and (ii) have a common root, therefore common root must be imaginary and hence both roots will be common.

Therefore equations (i) and (ii) are identical

$\therefore \quad \frac{a}{1} = \frac{b}{2} = \frac{c}{9} \quad \therefore \quad a : b : c = 1 : 2 : 9$

Self practice problems :

x	0	1	∞	$-\infty$
y	3	4	$-\infty$	$-\infty$

Example # 6 : Find all the integral values of a for which the quadratic equation $(x-a)(x-10)+1=0$ has integral roots

Solution : Here the equation is $x^2-(a+10)x+10a+1=0$. Since integral roots will always be rational it means D should be a perfect square

From (i) $D = a^2 - 20a + 96$

$\Rightarrow \quad D = (a-10)^2 - 4 \qquad \Rightarrow \quad 4 = (a-10)^2 - D$

If D is a perfect square it means we want difference of two perfect square as 4 which is possible only when $(a-10)^2 = 4$ and $D = 0$.

$\Rightarrow \quad (a-10) = \pm 2 \qquad \Rightarrow \quad a = 12, 8$

Solution : By given condition $(x-a)(x-b)-k \equiv (x-c)(x-d)$

or $(x-c)(x-d)+k \equiv (x-a)(x-b)$

Solution : Let $x-\alpha$ be a common factor of $x^2-11x+a$ and $x^2-14x+2a$.

Then $x=\alpha$ will satisfy the equations $x^2-11x+a=0$ and $x^2-14x+2a=0$.

$\therefore \quad \alpha^2 - 11\alpha + a = 0$ and $\quad \alpha^2 - 14\alpha + 2a = 0$

i.e. $\quad 4(a+b+c)^2 - 4.3\,(bc+ca+ab) = 0$

or $\quad (a+b+c)^2 - 3(bc+ca+ab) = 0$

or $\quad \frac{1}{2}\left((a-b)^2 + (b-c)^2 + (c-a)^2\right) = 0$

which is possible only when $a = b = c$.

(iv) Both roots are opposite in sign.
(v) Both roots are equal in magnitude but opposite in sign.

(9) If $P(x) = ax^2 + bx + c$, and $Q(x) = -ax^2 + dx + c$, $ac \neq 0$ then prove that $P(x) \cdot Q(x) = 0$ has atleast two real roots.

Answers. (5) 0, 3

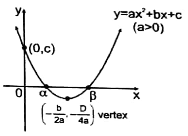
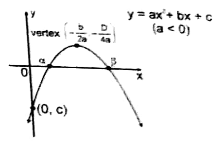
7. Graph of Quadratic Expression:

★ the graph between x, y is always a parabola.

★ the co-ordinate of vertex are $\left(-\frac{b}{2a}, -\frac{D}{4a}\right)$

★ If $a > 0$ then the shape of the parabola is concave upwards & if $a < 0$ then the shape of the parabola is concave downwards.





★ the parabola intersect the y–axis at point (0, c).

★ the x–co–ordinate of point of intersection of parabola with x–axis are the real roots of the quadratic equation f (x) = 0. Hence the parabola may or may not intersect the x–axis.

8. Range of Quadratic Expression $f(x) = ax^2 + bx + c$.

(i) Range :

If $a > 0 \quad \Rightarrow \quad f(x) \in \left[-\frac{D}{4a}, \infty\right)$

If $a < 0 \quad \Rightarrow \quad f(x) \in \left(-\infty, -\frac{D}{4a}\right]$

Hence maximum and minimum values of the expression f (x) is $-\frac{D}{4a}$ in respective cases and it occurs at $x = -\frac{b}{2a}$ (at vertex).

(ii) Range in restricted domain:
Given $x \in [x_1, x_2]$

(a) If $-\frac{b}{2a} \notin [x_1, x_2]$ then,

$f(x) \in \left[\min\{f(x_1), f(x_2)\},\ \max\{f(x_1), f(x_2)\}\right]$

(b) If $-\frac{b}{2a} \in [x_1, x_2]$ then,

$f(x) \in \left[\min\left\{f(x_1), f(x_2), -\frac{D}{4a}\right\},\ \max\left\{f(x_1), f(x_2), -\frac{D}{4a}\right\}\right]$

9. Sign of Quadratic Expressions :

The value of expression $f(x) = ax^2 + bx + c$ at $x = x_0$ is equal to y–co–ordinate of the point on parab[ola] $y = ax^2 + bx + c$ whose x–co–ordinate is x_0. Hence if the point lies above the x-axis for some $x = x_0$, t[hen] $f(x_0) > 0$ and vice–versa.

(iii) Dividing the equation (i) by a, $x^2 + \frac{b}{a}x + \frac{c}{a} = 0$

$\Rightarrow$ $x^2 - \left(\frac{-b}{a}\right)x + \frac{c}{a} = 0$ $\Rightarrow$ $x^2 - (\alpha + \beta)x + \alpha\beta = 0$

$\Rightarrow$ $x^2 -$ (sum of the roots) x + (product of the roots) = 0

Hence we conclude that the quadratic equation whose roots are α & β is $x^2 - (\alpha + \beta)x + \alpha\beta = 0$

Example # 2 : If α and β are the roots of $ax^2 + bx + c = 0$, find the equation whose roots are $\alpha+2$ and $\beta+2$.

Solution : Replacing x by x – 2 in the given equation, the required equation is

$a(x-2)^2 + b(x-2) + c = 0$ i.e., $ax^2 - (4a - b)x + (4a - 2b + c) = 0$.

Example # 3 : The coefficient of x in the quadratic equation $x^2 + px + q = 0$ was taken as 17 in place of 13, its roots were found to be – 2 and – 15. Find the roots of the original equation.

Solution : Here $q = (-2) \times (-15) = 30$, correct value of p = 13. Hence original equation is

$x^2 + 13x + 30 = 0$ as $(x + 10)(x + 3) = 0$

(iii) If the coefficients of the equation f(x) = 0 are all real and $\alpha + i\beta$ is its root, then $\alpha - i\beta$ is also a root. i.e. imaginary roots occur in conjugate pairs.

(iv) An equation of odd degree will have odd number of real roots and an equation of even degree will have even numbers of real roots.

(v) If the coefficients in the equation are all rational & $\alpha + \sqrt{\beta}$ is one of its roots, then $\alpha - \sqrt{\beta}$ is also a root where $\alpha, \beta \in Q$ & β is not square of a rational number.

(vi) If there be any two real numbers 'a' & 'b' such that f(a) & f(b) are of opposite signs, then f(x) = 0 must have odd number of real roots (also atleast one real root) between 'a' and 'b'.

(vii) Every equation f(x) = 0 of degree odd has atleast one real root of a sign opposite to that of its last term. (If coefficient of highest degree term is positive).

(c) $x^3 + 2qx^2 + q^2x - r^2 = 0$ (d) $x^3 - 3x^2r + (3r^2 + q^3)x - r^3 = 0$

6. Nature of Roots:

Consider the quadratic equation, $ax^2 + bx + c = 0$ having α, β as its roots;

$D \equiv b^2 - 4ac$

D = 0
Roots are equal i.e. $\alpha = \beta = -b/2a$
& the quadratic expression can be expressed
as a perfect square of a linear polynomial

$D \neq 0$
Roots are unequal

$a, b, c \in R$ & $D > 0$
Roots are real

$a, b, c \in R$ & $D < 0$
Roots are imaginary $\alpha = p + iq$, $\beta = p - iq$

$a, b, c \in Q$ &
D is square of a rational number
$\Rightarrow$ Roots are rational
$\downarrow$
$a = 1$, $b, c \in I$ & D is square of an integer
$\Rightarrow$ Roots are integral.

$a, b, c \in Q$ &
D is not square of a rational number
$\Rightarrow$ Roots are irrational
i.e. $\alpha = p + \sqrt{q}$, $\beta = p - \sqrt{q}$

Example # 5 : For what values of m the equation $(1 + m)x^2 - 2(1 + 3m)x + (1 + 8m) = 0$ has equal roots.

Solution : Given equation is $(1 + m)x^2 - 2(1 + 3m)x + (1 + 8m) = 0$ ....(i)

Let D be the discriminant of equation (i).

Roots of equation (i) will be equal if D = 0

or $4(1 + 3m)^2 - 4(1 + m)(1 + 8m) = 0$

or $4(1 + 9m^2 + 6m - 1 - 9m - 8m^2) = 0$

or $m^2 - 3m = 0$ or, $m(m - 3) = 0$

$\therefore$ $m = 0, 3$.

QUADRATIC EQUATION

A man is like a fraction whose numerator is what he is and whose denominator is what he thinks of himself. The larger the denominator the smaller the fraction.........
Tolstoy, Count Leo Nikolayevich

1. Polynomial :

A function f defined by $f(x) = a_n x^n + a_{n-1} x^{n-1} + \ldots\ldots + a_1 x + a_0$
where $a_0, a_1, a_2, \ldots\ldots, a_n \in R$ is called a polynomial of degree n with real coefficients ($a_n \neq 0$, $n \in W$).
If $a_0, a_1, a_2, \ldots\ldots, a_n \in C$, it is called a polynomial with complex coefficients.

2. Quadratic polynomial & Quadratic equation :

A polynomial of degree 2 is known as quadratic polynomial. Any equation f(x) = 0, where f is a quadratic polynomial, is called a quadratic equation. The general form of a quadratic equation is

$ax^2 + bx + c = 0$ ....(i)

Where a, b, c are real numbers, $a \neq 0$.
If a = 0, then equation (i) becomes linear equation.

3. Difference between equation & identity :

If a statement is true for all the values of the variable, such statements are called as identities. If the statement is true for some or no values of the variable, such statements are called as equations.

Example :
(i) $(x + 3)^2 = x^2 + 6x + 9$ is an identity
(ii) $(x + 3)^2 = x^2 + 6x + 8$, is an equation having no root.
(iii) $(x + 3)^2 = x^2 + 5x + 8$, is an equation having – 1 as its root.

A quadratic equation has exactly two roots which may be real (equal or unequal) or imaginary.
$ax^2 + bx + c = 0$ is:

★	a quadratic equation if	$a \neq 0$	Two Roots
★	a linear equation if	$a = 0, b \neq 0$	One Root
★	a contradiction if	$a = b = 0, c \neq 0$	No Root
★	an identity if	$a = b = c = 0$	Infinite Roots

If $ax^2 + bx + c = 0$ is satisfied by three distinct values of 'x', then it is an identity.

Example # 1 : (i) $3x^2 + 2x - 1 = 0$ is a quadratic equation here a = 3.
(ii) $(x + 1)^2 = x^2 + 2x + 1$ is an identity in x.

Solution : Here highest power of x in the given relation is 2 and this relation is satisfied by three different values x = 0, x = 1 and x = – 1 and hence it is an identity because a polynomial equation of n^{th} degree cannot have more than n distinct roots.

4. Relation Between Roots & Co-efficients:

(i) The solutions of quadratic equation, $ax^2 + bx + c = 0$, ($a \neq 0$) is given by

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

The expression, $b^2 - 4ac \equiv D$ is called discriminant of quadratic equation.

(ii) If α, β are the roots of quadratic equation,
$ax^2 + bx + c = 0$ ....(i)
then equation (i) can be written as
$a(x - \alpha)(x - \beta) = 0$
or $ax^2 - a(\alpha + \beta)x + a\alpha\beta = 0$ ......(ii)
equations (i) and (ii) are identical,

$\therefore$ by comparing the coefficients sum of the roots, $\alpha + \beta = -\dfrac{b}{a} = -\dfrac{\text{coefficient of } x}{\text{coefficient of } x^2}$

and product of the roots, $\alpha\beta = \dfrac{c}{a} = \dfrac{\text{constant term}}{\text{coefficient of } x^2}$
